

SOLAR WORLD CINEMA

THE SOLAR POWERED MOBILE CINEMA BRINGS UNSEEN FILMS TO UNUSUAL PLACES

Solar World Cinema is an international network of solar powered mobile cinemas. All the projection equipment (inflatable screen, sound and projector) is 100% powered by solar energy. Each Solar Cinema performs an itinerant tour of educational workshops and free film screenings in cities and towns in different parts of the world. Solar World Cinema is based in the Netherlands and founder of the network of solar powered mobile cinema's around the world.

A broad range of international films and customized workshops on sustainability and cinematography are brought to a wide international audience. The Solar Cinema itself is a strong communication tool. Its screen offers space for promotional and educational videos, and it is a perfect example of a sustainable energy application.

Our goal is to democratize the access to cinema, creating a special platform to screen films with social matters for free. Turning public spaces into self sustainable open-air cinemas. Solar Cinema brings unseen films to unusual places.

Our objective is to raise awareness and stress the importance of switching to renewable energies. This awareness is embedded in the daily life of the audience by organising free screenings, workshops and cultural activities that generate impact through education.

Furthermore we are an alternative distributor of independent cinema that reaches an audience in remote places that are normally difficult to reach. We go beyond the borders of the traditional cinematic world.

Not only the Solar Cinema itself is an innovative tool that brings sustainable solutions in people's daily life, but also bringing inspiring content is an important mission. Therefore we program inspirational and artistic short films in our ongoing **Go Greener Short** film program: a selection of inspiring, fresh, non-moralistic short films that have a green or sustainable message or theme. These short films are screened during each screening of Solar Cinema around the globe.

We believe it is important to inspire people through culture. Through film screenings but also with customized workshops. In the workshops we offer, short films are made which are presented on our screens. We believe that educational workshops combined with the film screenings have an even bigger impact on communities. Children or youngsters participating in the workshops spread a sustainable message. Inviting families and friends to the film screenings and spreading their freshly acquired knowledge.

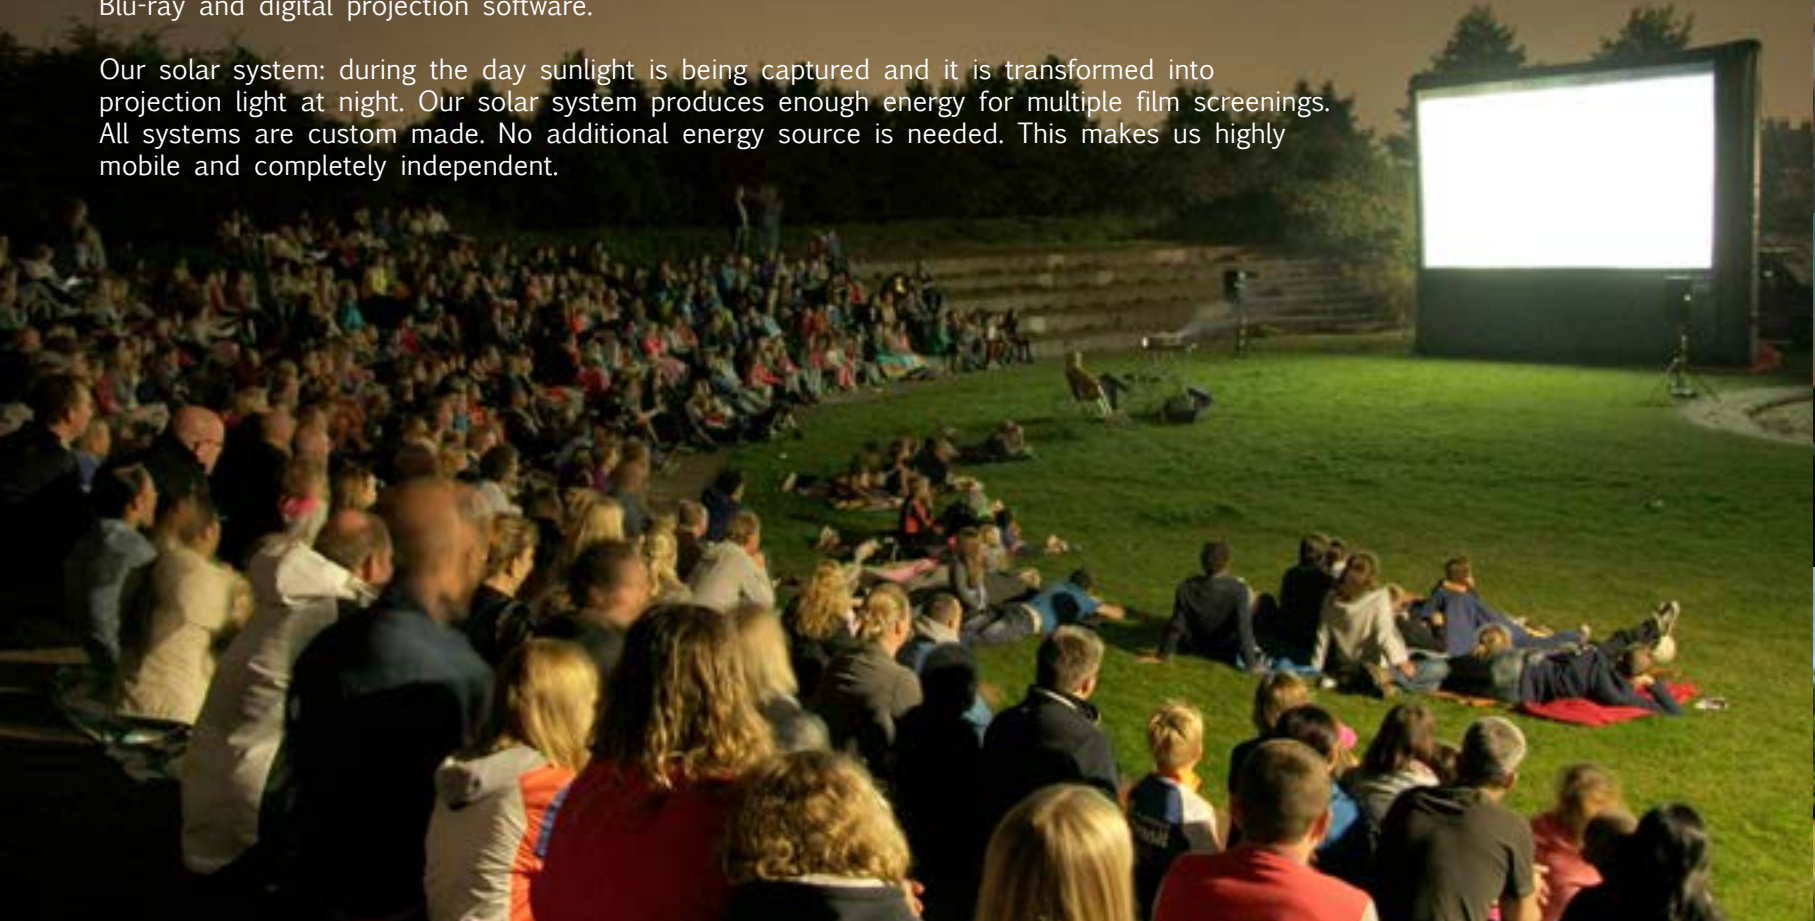

Goals of the workshops:

1. Educate about sustainable energy
2. Stimulate cinematographic talent
3. Inspire people to take care about their environment
4. Create regional content and audiences for independent cinema
5. Bridge international borders through culture and connect audiences through content.

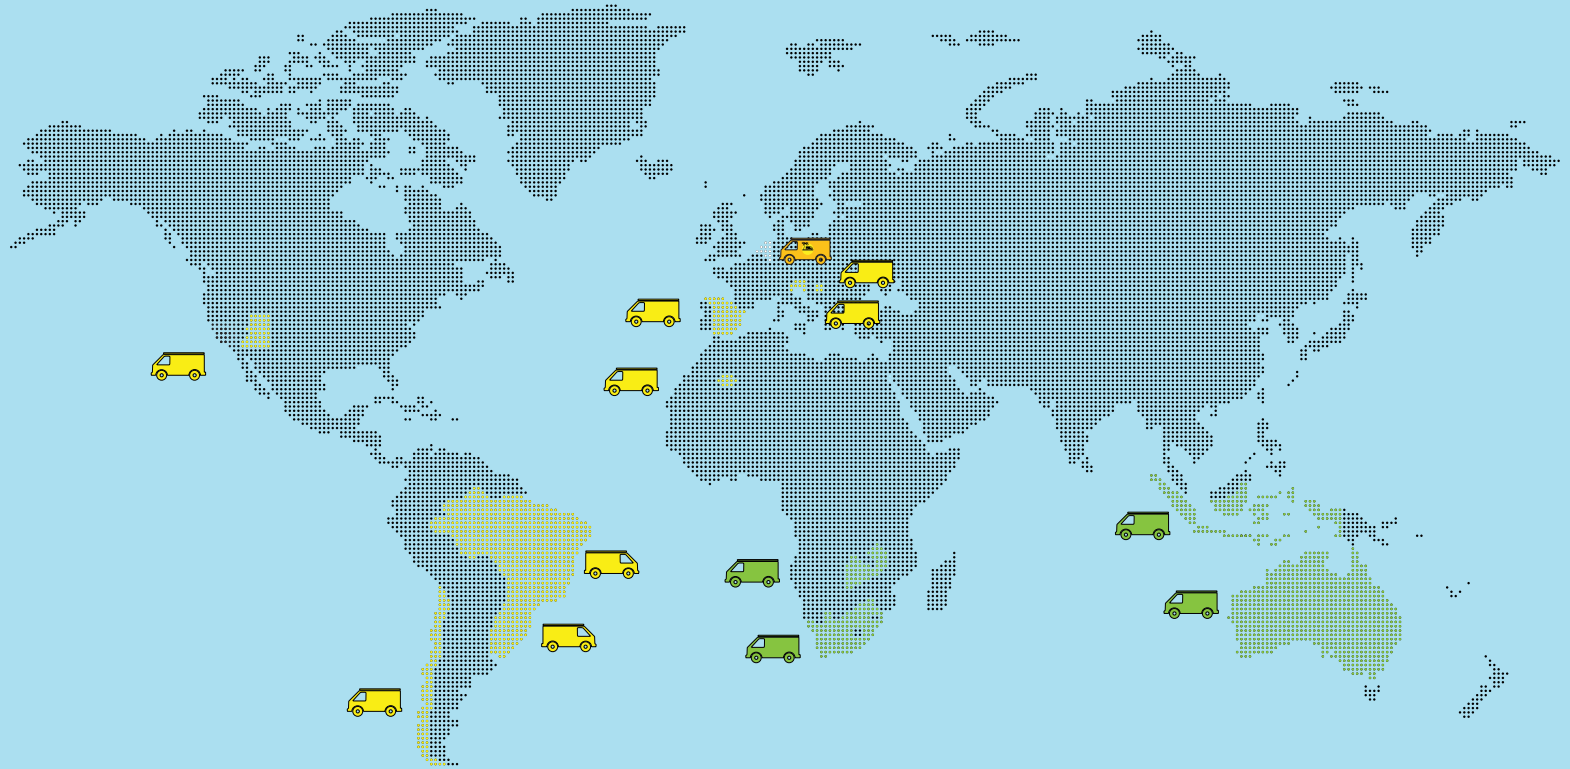

In order to reach these goals, we have created different workshops, each adaptable to a different audience and culture. We are an international organization by heart that aims to bridge gaps and borders through culture.

The cinematic experience is an important characteristic of our work. Therefore we work with high quality screening and sound equipment. We work with equipment that has the advantage of being highly mobile, easy to set up and has the capacity to serve for massive exhibitions in the open air. All equipment is especially selected with a low power usage. We use different screens, in various sizes, both structural as inflatable ones, projectors of 5.500 ANSI lumens or more (HD), Blu-ray and digital projection software.

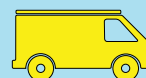

Our solar system: during the day sunlight is being captured and it is transformed into projection light at night. Our solar system produces enough energy for multiple film screenings. All systems are custom made. No additional energy source is needed. This makes us highly mobile and completely independent.
